MONGO RELATIONSHIPS

ONE TO FEW

Embed the data directly in the document!

```
{
  name: 'Tommy Cash',
  savedAddresses : [
    { street: 'Rahukohtu 3', city: 'Tallinn ', country: 'Estonia' },
    { street: 'Rävala 5', city: 'Tallinn ', country: 'Estonia' }
  ]
}
```
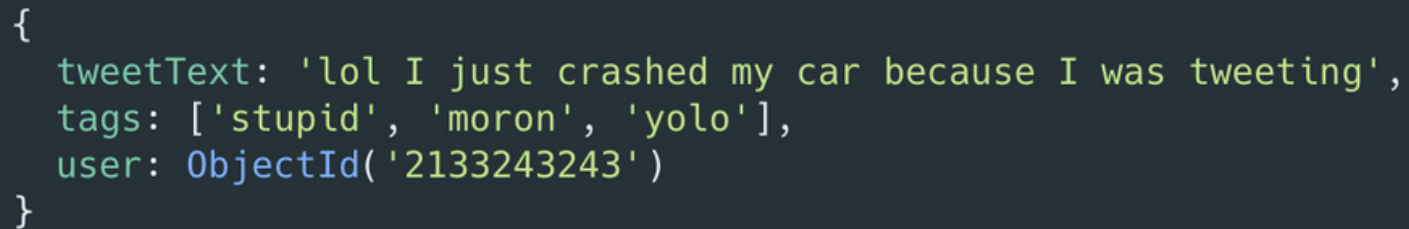

ONE TO MANY

One option is to store your data separately, but then store references
to document ID's somewhere inside the parent:

```
{
    farmName: 'Full Belly Farms',
    location: 'Guinda, CA',
    produce : [
        ObjectID('2819781267781'),
        ObjectID('1828678675667'),
        ObjectID('8187777231283'),
    ]
}
```

ONE TO BAJILLIONS

With thousands or more documents, it's more efficient to store a reference to the parent on the child document.

```
{
  tweetText: 'lol I just crashed my car because I was tweeting',
  tags: ['stupid', 'moron', 'yolo'],
  user: ObjectId('2133243243')
}
```
